FEDERAL - STATE - PRIVATE COOPERATIVE SNOW SURVEYS

UNITED STATES DEPARTMENT of AGRICULTURE...SOIL CONSERVATION SERVICE,

and

STATE ENGINEER of UTAH

In cooperation with U.S. Forest Service, Bureau of Reclamation, Utah Fish and Game Dept., Utah Agricultural Experiment Station, U.S. National Park Service, U.S. Geological Survey; and other Federal, State, and private organizations.

APR. 1, 1967

TO RECIPIENTS OF WATER SUPPLY OUTLOOK REPORTS:

Most of the usable water in western states originates as mountain snowfall. This snowfall accumulates during the winter and spring, several months before the snow melts and appears as streamflow. Since the runoff from precipitation as snow is delayed, estimates of snowmelt runoff can be made well in advance of its occurrence. Streamflow forecasts published in this report are based principally on measurement of the water equivalent of the mountain snowpack.

Forecasts become more accurate as more of the data affecting runoff are measured. All forecasts assume that climatic factors during the remainder of the snow accumulation and melt season as they affect runoff will add to be an effective average. Early season forecasts are therefore subject to a greater change than those made on later dates.

The snow course measurement is obtained by sampling snow depth and water equivalent at surveyed and marked locations in mountain areas. A total of about ten samples are taken at each location. The average of these are reported as snow depth and water equivalent. These measurements are repeated in the same location near the same dates each year.

Snow surveys are made monthly or semi-monthly from January 1 through June 1 in most states. There are about 1400 snow courses in Western United States and in the Columbia Basin in British Columbia. In the near future, it is anticipated that automatic snow water equivalent sensing devices along with radio telemetry will provide a continuous record of snow water equivalent at key locations.

Detailed data on snow course and soil moisture measurements are presented in state and local reports. Other data or reservoir storage, summaries of precipitation, current streamflow, and soil moisture conditions at valley elevations are also included. The report for Western United States presents a broad picture of water supply outlook conditions, including selected streamflow forecasts, summary of snow accumulation to date, and storage in larger reservoirs.

Snow survey and soil moisture data for the period of record are published by the Soil Conservation Service by states about every five years. Data for the current year is summarized in a West-wide basic data summary and published about October 1 of each year.

Listed below are water supply outlook reports based on Federal–State–Private Cooperative snow surveys. Those published by the Soil Conservation Service may be obtained from Soil Conservation Service, Room 507, Federal Building, 701 N. W. Glisan, Portland, Oregon 97209.

PUBLISHED BY SOIL CONSERVATION SERVICE

D. A. WILLIAMS, Administrator

The Soil Conservation Service publishes reports following the principal snow survey dates from January 1 through June 1 in cooperation with state water administrators, agricultural experiment stations and others. Copies of the reports for Western United States and all state reports may be obtained from Soil Conservation Service, Western Regional Technical Service Center, Room 507, 701 N. W. Glisan, Portland, Oregon 97209.

Copies of state and local reports may also be obtained from state offices of the Soil Conservation Service in the following states:

WATER SUPPLY OUTLOOK

APRIL 5, 1967

Mountain precipitation was quite variable over the state during the past month, averaging near, but generally below normal in the north and, for the second consecutive month, much below normal in the south and southeast. March was also comparatively warm, averaging 3% to 4% above normal. Streamflow was above average in the north and east, but somewhat below average in the south.

The warm, dry, windy weather of March, which resulted in unusually heavy melting of low and intermediate elevation snowpacks, dropped water prospects in central and southern areas 15% to 35% compared to a month ago and 5% to 20% in the north. The current outlook is for about 25% to 65% of average streamflow from most watersheds of the Sevier, Virgin, Beaver, Escalante, Fremont, and Muddy rivers. The brightest outlook in any of this southern section is for Clear Creek near Sevier and for streams coming from Monroe mountain, where about 80% of average runoff is expected.

If subsequent spring weather is near normal, most of the major watersheds of central and northern Utah should yield from 85% to 110% of average streamflow. Included among these are the Logan, Bear, Weber, Provo, and American Fork rivers, the inflow to Utah Lake, the Cottonwood Creeks near Salt Lake City and Chalk Creek near Coalville; also, all streams of the Uintah Basin, the inflow to Strawberry and Scofield reservoirs, and tributaries of the San Pitch and San Rafael rivers north of the Ephraim-Castle Dale area. The outlook is less favorable (65% to 85% of average) for the lower elevation streams and tributaries in north and central Utah, this includes the Ogden River and other nearby streams which head near Monte Cristo peak, East Canyon Creek near Morgan, Parley's Creek near Salt Lake, streams near Farmington, Tooele, and Nephi, the Spanish Fork River and Hobble Creek near Springville. In Cache Valley the Little Bear River is forecast at only 45% of the 1948-62 average.

WATER SUPPLY OUTLOOK (continued)

In Grand and San Juan counties of southeastern Utah the outlook is particularly poor. Streams here will yield about 20% to 35% of average flows. Near Monticello the Buckboard Flat snow course (elev. 9,000 ft.) set a new record low reading this month. The snowpack has only 2.2 inches of water, about one third of the previous low of 6.7 inches measured in 1951. Average snow water content is 14.4 inches. This course was first measured in 1930.

Near Moab the LaSal mountain snow course (elev. 8,800 ft.) has no snow. The only other time this has happened in the 37 years of its record was during the drought of 1934.

April-July inflow to Lake Powell and Flaming Gorge reservoirs is forecast at 6.2 and 1.06 million acre feet, respectively, assuming no change in upstream storage. This represents 81% and 94% of the 1948-62 average inflow.

⁽¹³⁾ Observed flow plus diversion through Duchesne Tunnel. (14) Observed flow plus change in storage in Moon Lake Reservoir. (15) Observed flow plus change in storage reservoir.

GENERAL FOOTNOTES

⁽a) Runoff forecasts are based principally on mountain snow cover and on the assumption that precipitation and temperature will be near average from the present time to the end of the forecast period. Appreciable deviations from normal of temperature and/or precipitation will correspondingly modify these forecasts. The discharge data is taken from preliminary records of the U.S. Geological Survey. (b) 1948-62, 15 year period. *Partly estimated.
